The Data Science Process

Step 1:

- Frame a Question
- Define a Goal
- What is the business need driving this project?

The Data Science Process

Raw Data is Collected/Get the Data

- Connect to a Database (eg. SQL)
- Use an API (Application Programming Interface)
- Scrape from the Web
- Find Open Data (eg. UNData, data.nashville.gov)

The Data Science Process

Data is Processed/Clean Data/Enrich Data

- Checking for missing values/improperly formatted values/duplicates
- Extracting new variables
- Combining/Merging Multiple Data Sources
- Consolidating/Filtering
- Transforming/Tidying (Pivot or Melt)

The Data Science Process

Exploratory Analysis

- Summary Statistics
- Groupby + Aggregation (Split-Apply-Combine)
- Exploratory Plots
- Analyzing Distributions - Univariate and Bivariate
- Looking for Outliers/Anomalies
- Look for and Analyze Patterns
- Ask and (attempt to) Answer Questions about the Data

The Data Science Process

Machine Learning Algorithms/Models

- Uncovering trends/patterns/groupings in the data (unsupervised)
- How can we make predictions on new data? (supervised)

This will be the focus of the later portions of the bootcamp.

The Data Science Process

Visualize and Communicate

- Create Effective Visualizations to Communicate your Findings
- Data Storytelling/Presentation

Data Question 1
